# Algorithm Improvement for 'Coca-Cola Can' Recognition

<https://stackoverflow.com/questions/10168686/image-processing-algorithm-improvement-for-coca-cola-can-recognition>

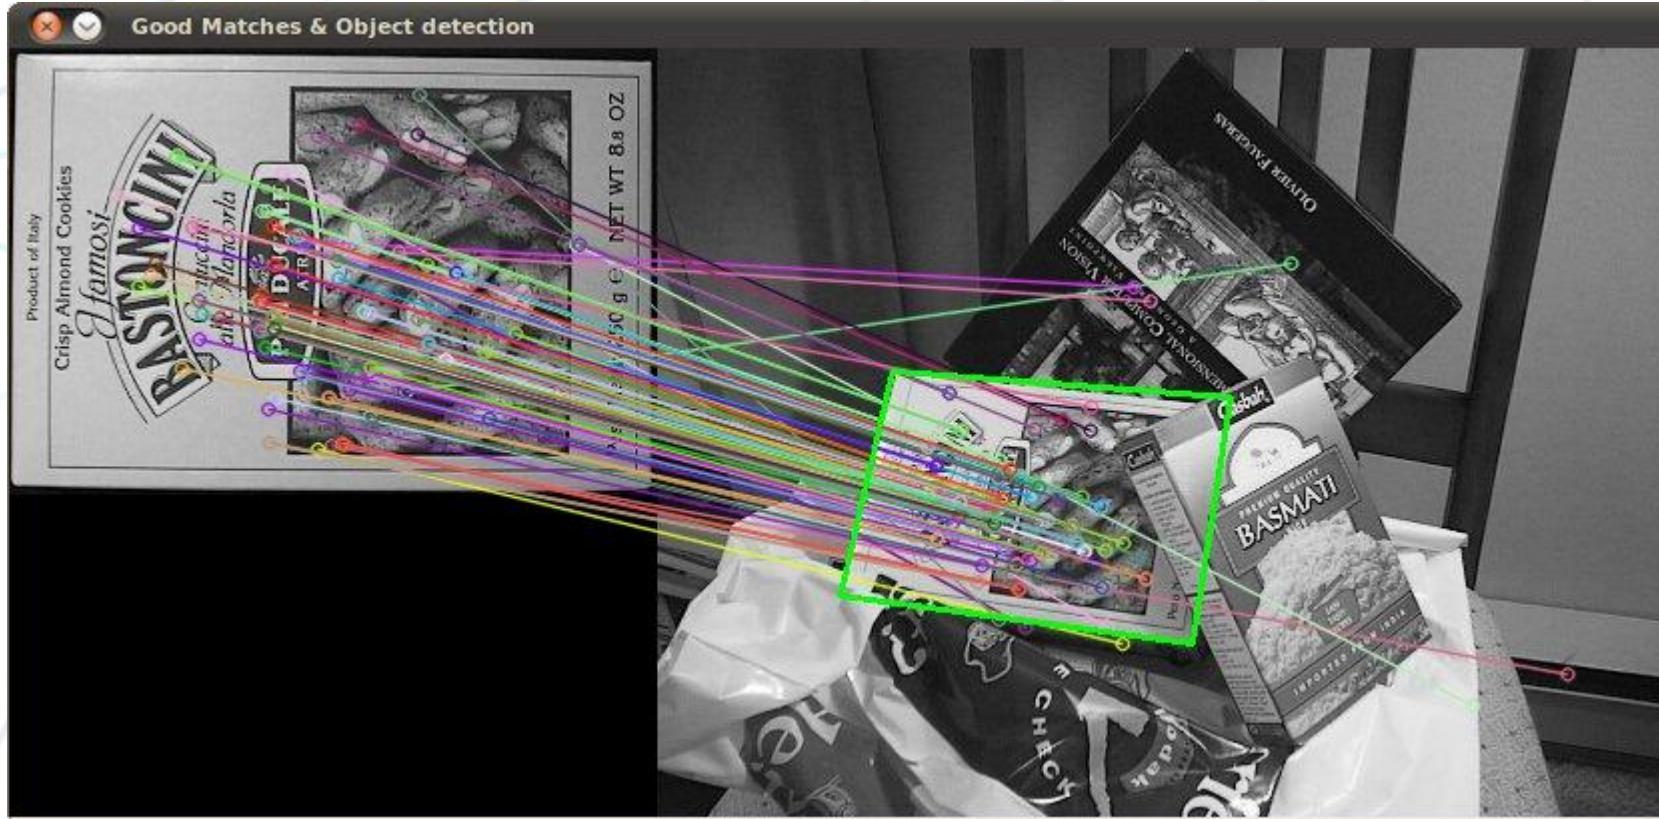

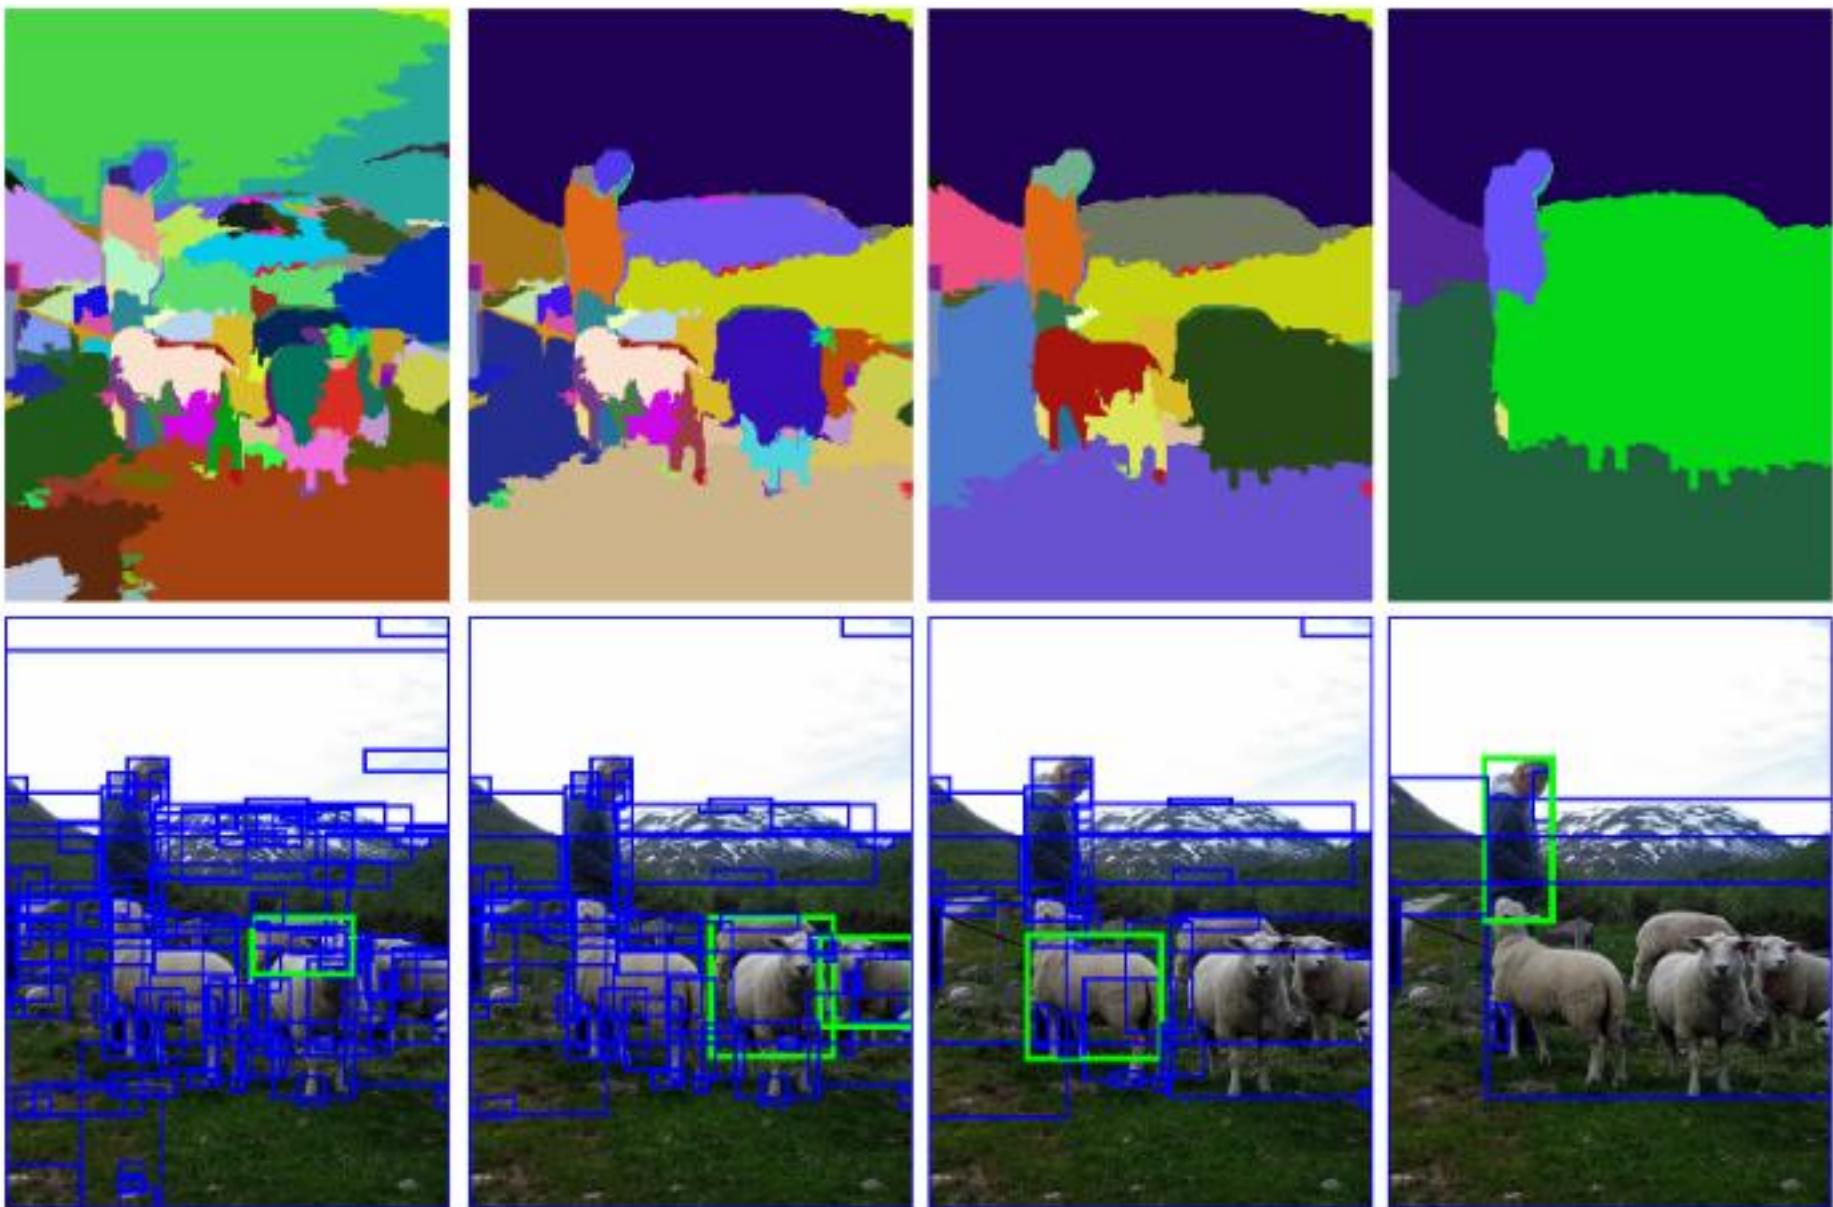

- It is **extremely slow!** I'm not stressing this enough. Almost a full day was needed to process the 30 test images, obviously because I had a very high scaling factor for rotation and translation, since some of the cans were very small.
- It was completely lost when bottles were in the image, and for some reason almost always found the bottle instead of the can (perhaps because bottles were bigger, thus had more pixels, thus more votes)
- Fuzzy images were also no good, since the votes ended up in pixel at random locations around the center, thus ending with a very noisy heat map.
- Invariance in translation and rotation was achieved, but not in orientation, meaning that a can that was not directly facing the camera objective wasn't recognized.

# Focal loss

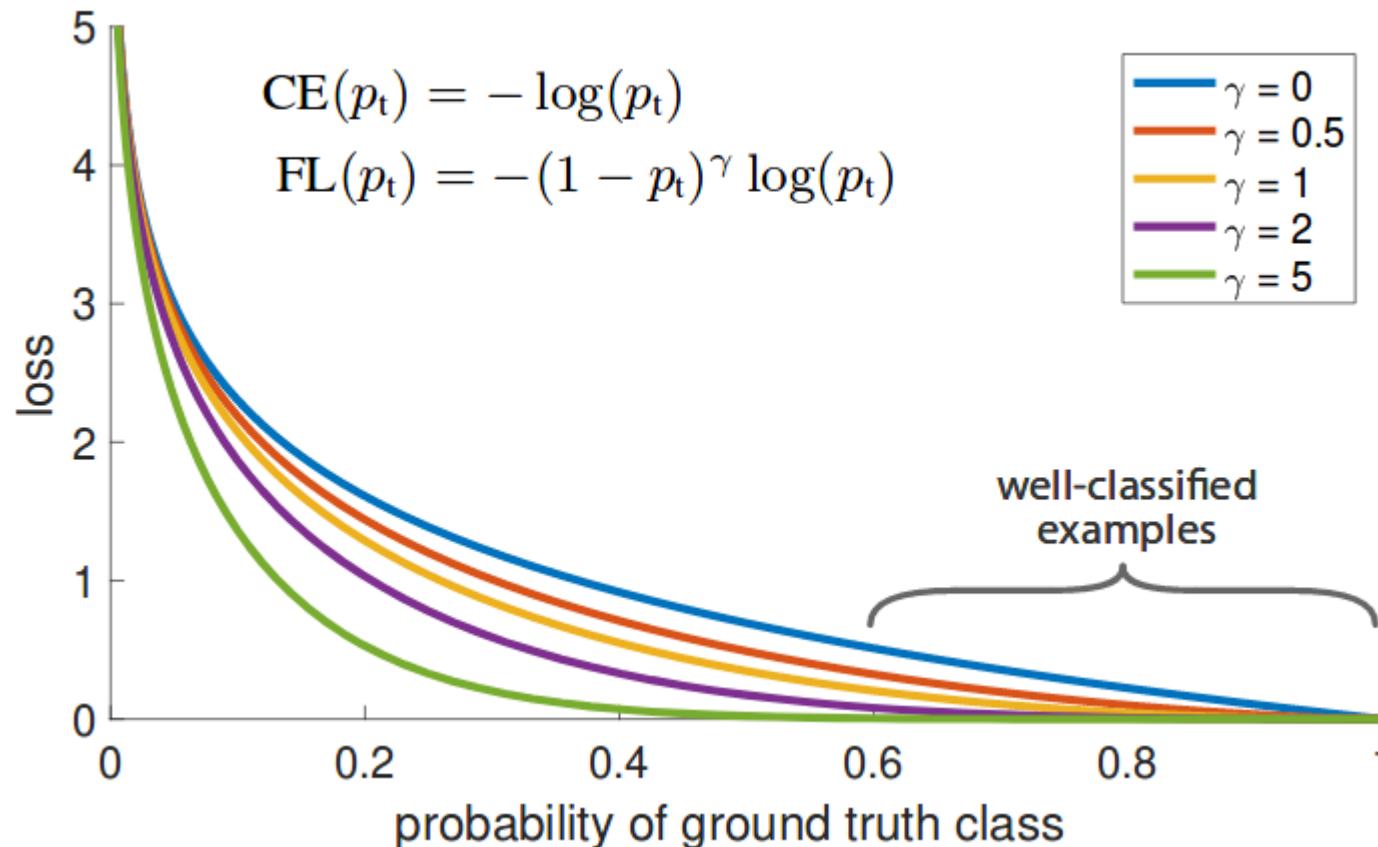

$$p_t = \begin{cases} p & \text{if } y = 1 \\ 1 - p & \text{otherwise,} \end{cases}$$

$$\text{FL}(p_t) = -(1 - p_t)^\gamma \log(p_t)$$

$$\text{CE}(p_t) = -\log(p_t)$$

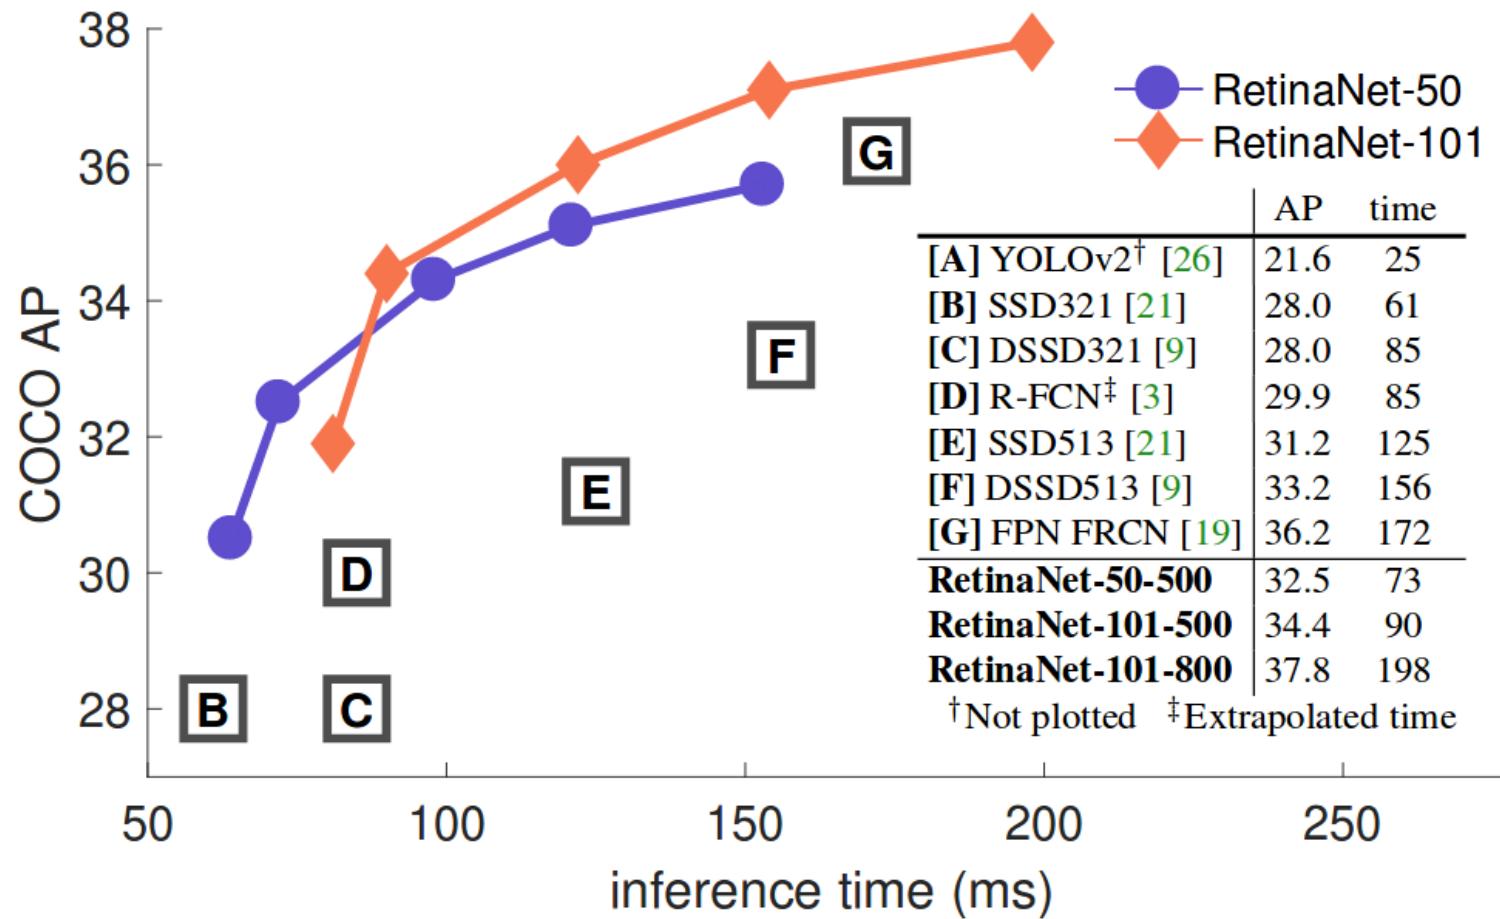

$$\text{FL}(p_t) = -(1 - p_t)^\gamma \log(p_t)$$

- $\gamma = 0$
- $\gamma = 0.5$
- $\gamma = 1$
- $\gamma = 2$
- $\gamma = 5$
